Configure Scriptless Test Deployment

Use scriptless test deployment configuration to prepare Scenario Editor tests for execution in the intended AIQ environment. Keep deployment settings aligned with the target environment, Test Node capacity, browser support, and test data strategy.

Before deployment

- Confirm the target environment, browser or device requirements, and Test Node availability.
- Validate test data and credentials using approved secure configuration methods.
- Review scenario waits, locators, and validations for maintainability.
- Run a focused validation execution before adding the test to a larger suite.

Deployment notes

1. Document environment-specific settings and avoid hard-coding them into steps.
2. Keep reusable data in DPLs or approved data sources.
3. Review output after the first scheduled or suite execution.
