

Legacy LoadRunner Script Creation Reference

Last reviewed: September 29, 2026

This page is retained as a legacy reference for teams that still need to create LoadRunner scripts for AIQ-related workflows.

What changed in this article

- Marked LoadRunner script creation as legacy/environment-specific content rather than current default AIQ guidance.
- Added checks for protocol choice, correlation needs, parameterization, runtime settings, and data files before AIQ execution.
- Separated script creation from download/admin/runtime configuration, which are covered by the other LoadRunner pages.

Validation workflow

1. Confirm the customer still requires LoadRunner scripts before creating new assets.
2. Create or update the script with required protocol, parameters, correlations, and test data.
3. Run a small validation before connecting the script to AIQ execution.

Review note: Use this page only for legacy LoadRunner support or migration work.
