

Set Up Deep Link Tester for AIQ Mobile Testing

Set Up Deep Link Tester for AIQ Mobile Testing

Use a deep link tester when an AIQ mobile test needs to launch an app into a specific route, screen, or state. Deep links should be validated before they are added to repeatable mobile scenarios.

Prerequisites

- Confirm the app build installed on the device or emulator supports the target scheme, universal link, or app link.
- Document the exact deep link format, required parameters, and expected landing screen.
- Use test accounts and non-production data when validating app navigation.
- Reset the application state between runs when the deep link depends on login, cache, or stored preferences.

Validation workflow

1. Open the deep link manually on the target device and confirm the expected screen appears.
2. Add the deep link launch step to the AIQ mobile flow.
3. Run the test once with logging enabled and capture evidence.
4. Add assertions for the landing screen so failures are detected immediately.
