

Sample SQL Scripts for AIQ Testing

Recommended guidance

Sample SQL scripts should demonstrate safe, repeatable validation patterns for AIQ testing. Examples must avoid production data, destructive statements, and customer-specific credentials.

Example hygiene

- Use placeholder connection values, schema names, table names, and credentials.
- Prefer read-only queries unless the article explicitly covers controlled setup or cleanup.
- Explain expected results, assumptions, and failure conditions.
- Include transaction or rollback guidance when data changes are required.

Validation workflow

1. Run scripts in a non-production database first.
2. Confirm permissions match the intended AIQ execution account.
3. Review output in AIQ and database logs.
4. Remove or update obsolete examples that no longer match current SQL testing workflows.
