

Use Instant Replay to Review Web Test Failures

Last reviewed: September 30, 2026

Use this article when reviewing an AIQ web test execution and you need replay evidence to understand where a scenario failed.

What changed in this article

- Clarified Instant Replay as a results-review and failure-analysis tool rather than a broad web-testing feature page.
- Added checks for step timing, screenshots, network/output logs, captured evidence, and differences between replay and live execution.
- Connected the workflow to Scenario Editor maintenance decisions after a failure is confirmed.

Validation workflow

1. Open the failed execution and review the failing step, screenshot, output, and timing evidence.
2. Use Instant Replay to compare expected behavior with the recorded execution path.
3. Update waits, locators, data, or validations only after the replay evidence points to a concrete cause.

Review note: This article now helps reviewers diagnose failures without treating replay as proof by itself.
