

Validation Workbench

Overview

Last reviewed: September 30, 2026

Use this article to understand how Validation Workbench supports reusable validations for AIQ web testing workflows.

What changed in this article

- Converted the page into a current overview of Validation Workbench purpose and validation reuse.
- Added guidance for selecting what to validate, keeping validations deterministic, and reviewing evidence in results.
- Connected the page to Scenario Editor usage without overloading it with unrelated web-testing setup details.

Validation workflow

1. Define the validation goal and the evidence needed to prove it passed or failed.
2. Build the validation with stable inputs and expected values that can be reviewed later.
3. Run the validation from the related scenario and confirm the result appears clearly in output and reports.

Review note: This page now positions Validation Workbench as reusable validation support rather than a standalone vague feature page.
