

Generate Mobile Traffic for Performance Testing

Generate Mobile Traffic for Performance Testing

Use mobile traffic generation when performance testing must include requests produced from a mobile application or mobile browser flow. Keep the setup controlled so the captured traffic represents the target use case and can be repeated.

Before you start

- Confirm the mobile device or emulator can reach the application under test.
- Document the network path, proxy requirements, and test environment.
- Use a non-production account and test data approved for performance execution.

Recommended workflow

1. Capture the mobile traffic required for the scenario.
2. Review and clean the captured requests before scaling the run.
3. Parameterize dynamic values and test data.
4. Run a small validation execution, then increase load in controlled stages.
