

Mobile Testing Configurations in AIQ

Recommended guidance

Mobile testing configuration should define the device, platform, application build, automation framework, network access, permissions, and evidence requirements before execution. Keep configurations explicit so failures can be reproduced.

Configuration areas

- Device type, OS version, orientation, screen size, and locale.
- Application package, build version, installation method, and reset behavior.
- Network, proxy, certificates, VPN, and back-end environment.
- Permissions such as camera, location, notifications, files, or microphone.
- Test data, DPLs, accounts, screenshots, logs, and video evidence.

Maintenance workflow

1. Start with a smoke test on one known-good device.
2. Expand to device pools only after configuration is stable.
3. Review configuration after app, OS, browser, driver, or AIQ upgrades.
4. Document deviations from the standard mobile environment.
