Mobile Designer, AIQ's test design technology for native mobile apps, allows dev teams to take a mobile-first approach with their testing to meet their customers' mobile-first mindset. Its innovative visual accessor approach overcomes the limitations of other locators used by Appium, giving AIQ a more robust technical approach.

AISG + Automatic Regression Testing for mobile means teams can also leverage AIQ's cutting-edge autonomous testing approach.

AIQ provides testing for native mobile, mobile web, and hybrid apps in iOS and Android. It covers all your test needs, including functional, API, performance, and load tests to ensure your users

have an optimal experience.

Mobile Designer enables script recording and playback, a simpler approach to mobile test design than traditional mobile scripting. Click By Image allows Mobile Designer to incorporate screenshots into scripts.

AISG for mobile automatically identifies locators which can then be used in Mobile Designer scripts, making test creation even easier.

- Mobile scripts can be used in combination with other Test Designer scripts
- Fully data-driven test approach
- DevOps ready for CI/CD integration and results reporting
- Integrated with multiple cloud services: BrowserStack, SauceLabs, ExperiTest, and AWS Device Farm
- Screen timing accurate to +/- 15 ms
