

Service Suite API Testing Interface

Recommended guidance

Use the Service Suite API testing interface to build, run, and validate HTTP API checks in AIQ. The interface should help users configure requests, inspect responses, assert outcomes, and reuse extracted data.

What to review

- Request method, URL, headers, parameters, body, and authentication.
- Environment variables, DPL values, and reusable configuration.
- Response status, headers, body, timing, and extracted values.
- Assertions for technical validity and business expectations.
- Output Logs and evidence needed for troubleshooting.

Best practices

1. Start with a single known-good request before chaining calls.
2. Separate authentication/setup calls from business validation where useful.
3. Mask tokens and secrets in shared logs or screenshots.
4. Document dependencies on external APIs, rate limits, and test data.
