Appvance IQ Live Test Controller

The **Live Controller** provides real-time monitoring of scenario executions in Appvance IQ. It allows users to view execution data as it becomes available and monitor the current state and performance of a running test.

During a scenario execution, the Live Controller displays relevant information such as:

- Test case execution details
- Total transactions
- Successful and failed transactions
- Active virtual users
- Execution status and other real-time performance data

This information allows users to monitor a test while it is running and quickly identify changes in execution behavior, failures, or other conditions that may require attention.

The Live Controller is therefore an important component for monitoring and analyzing scenario executions in real time.
