

Control Test Execution

Control Test Execution

Use Test Controller execution controls to start, monitor, and stop AIQ test runs. Confirm the execution plan, environment, data, and test-node capacity before starting a load or scenario execution.

Before starting

- Verify the target environment and test data are approved for the run.
- Confirm Test Nodes are online and sized for the planned load.
- Review ramp-up, duration, and stop conditions.

During execution

1. Watch active users, throughput, errors, and output.
2. Pause or stop the run if the target environment becomes unstable or the test is invalid.
3. Capture the execution ID and relevant evidence for analysis.
