

Understand AIQ Reports

Last reviewed: September 22, 2026

Use AIQ reports to evaluate execution health, response timing, failures, throughput, and supporting evidence after a test run.

Recommended guidance

- Review reports after the run is complete for final analysis.
- Use live views for monitoring, but final reports for decisions.
- Compare runs only when test data, environment, and load profile are comparable.

Validation workflow

1. Open the completed execution report from Results Analysis.
2. Review summary status, duration, transaction counts, and failure rates.
3. Drill into failed steps or transactions before drawing conclusions.
4. Compare metrics against baseline and acceptance thresholds.
5. Export or share report links according to project reporting policy.

Note: A single report is evidence, not root cause. Correlate with logs, monitoring, and environment changes.
