

Run a Complete Traffic Scenario in AIQ

Last reviewed: September 25, 2026

Use this article when validating a full Traffic scenario from setup through execution and result review.

What changed in this article

- Clarified the sequence from traffic preparation to run execution and review.
- Added pre-run checks for target availability, data readiness, proxy/recording setup, and expected completion criteria.
- Added post-run checks for output, errors, captured transactions, and report readiness.

Validation workflow

1. Confirm environment, data, and traffic capture settings before starting the scenario.
2. Run the full scenario and monitor output for early failures.
3. Review transactions, errors, and results before marking the scenario ready for reuse.

Review note: Reframed this as an end-to-end Traffic scenario checklist instead of a generic “run scenario” page.
