

Lab Management in AIQ

Lab Management in AIQ

Lab Management helps organize the environments, devices, browsers, nodes, and resources used by AIQ tests. Keep lab entries accurate so scheduled executions can find the correct capacity and environment details.

Recommended guidance

- Use clear names for labs, nodes, devices, and environment groups.
- Record ownership, location, access requirements, and maintenance windows for shared resources.
- Keep device and node availability current so teams do not schedule work against unavailable capacity.
- Separate production-like, staging, and experimental resources when possible.
- Review permissions so only authorized users can change shared lab configuration.

Operational workflow

1. Create or update the lab entry with the correct resource details.
2. Assign nodes, devices, or environment resources to the right group.
3. Run a small validation test to confirm the resource can be selected and used.
4. Update lab notes after upgrades, device swaps, or network changes.
