

Legacy LoadRunner Administration Settings

Last reviewed: September 29, 2026

Use this page only when maintaining AIQ administration settings for environments that still execute LoadRunner assets.

What changed in this article

- Marked LoadRunner Admin as legacy administration content.
- Added checks for installation path, license availability, execution node access, environment variables, result storage, and permissions.
- Connected admin setup to the LoadRunner execution article so configuration is validated with a real test run.

Validation workflow

1. Confirm the LoadRunner installation and license details with the tool owner.
2. Configure AIQ paths, node access, and environment settings needed for execution.
3. Run a controlled LoadRunner script and verify AIQ can collect the expected results.

Review note: This page now keeps admin settings separate from script creation and execution guidance.
