

Set Up a Repository Connection in AIQ

Recommended guidance

Set up repository connections in AIQ when tests, services, data files, or reusable assets need to come from controlled source control. The connection should be tied to a clear project, branch strategy, and access model.

Before setup

- Confirm repository URL, provider, branch, folder path, and target AIQ project.
- Validate network, proxy, firewall, DNS, and certificate access from the AIQ host.
- Use approved Git credentials, tokens, or SSH keys with the minimum required access.
- Confirm whether AIQ should read only or also write back to the repository.

Validation workflow

1. Create or update the repository connection in Global Options.
2. Test connectivity and confirm the expected files appear.
3. Run a small Scenario Editor or Service Suite smoke test that uses repository content.
4. Document repository owner, branch policy, credential rotation, and rollback expectations.
