

Configure AIQ Jira Cloud Integration

Configure AIQ Jira Cloud Integration

Use the Jira Cloud integration to connect AIQ execution findings with Jira tracking. Configuration details can vary by Jira tenant and AIQ release, so confirm the approved authentication and permission model before setup.

Before configuring

- Confirm the Jira Cloud site, project, and issue type that AIQ should use.
- Use an approved integration account or token management process.
- Verify the account has permission to create and update the required Jira issues.
- Document required custom fields and mappings before enabling the integration.

Validation workflow

1. Configure the Jira Cloud connection in AIQ using approved credentials.
2. Create or update a test issue from a non-production execution.
3. Confirm required fields, links, and attachments are populated as expected.
4. Record troubleshooting notes for permission or field-mapping errors.
