

Run Data-Enabled TestNG Scenarios

Run Data-Enabled TestNG Scenarios

Use TestNG data providers for maintained Java/TestNG assets that still run through AIQ. For current Scenario Editor tests, prefer DPLs or approved AIQ test data sources when they can meet the same need.

Recommended setup

- Keep the data provider deterministic and easy to reset.
- Use approved non-production test data.
- Separate environment configuration from test data.
- Log enough context to diagnose which data row failed without exposing secrets.

Validation workflow

1. Run the TestNG suite locally or in CI with a small data set.
2. Confirm dependency packaging and Java version compatibility.
3. Execute from AIQ with a controlled data sample.
4. Review output for data, classpath, and environment failures before scaling.
