

Run Selenium Java Page Object Projects in AIQ

Run Selenium Java Page Object Projects in AIQ

Use this page for maintained Selenium Java Page Object Model projects that still need AIQ execution. Treat these projects as specialized or legacy assets and prefer Scenario Editor for new functional coverage when possible.

Maintenance checklist

- Keep page objects aligned with the current application UI.
- Use stable locators and explicit waits instead of fixed sleeps.
- Pin dependency, browser, driver, and Java versions through the approved build process.
- Keep environment configuration and secrets outside the source code.

AIQ validation

1. Build the project through the approved CI process.
2. Run a focused AIQ execution with a small data set.
3. Review output for driver, locator, data, and environment failures.
4. Record artifact version and execution ID for traceability.
