Run Approved OS Commands from Service Suite

Use this article only when a Service Suite scenario must run an approved operating-system command through AIQ in a controlled execution environment.

Validation workflow

1. Confirm the command is approved for the target AIQ environment and cannot expose credentials or modify unintended files.
2. Validate the working directory, arguments, permissions, expected output, timeout, and failure behavior in a non-production run.
3. Review stdout, stderr, exit status, and Service Suite logs before using the command in a scheduled or shared workflow.
