

# Run Node.js npm Code from Service Suite

# Run Node.js npm Code from Service Suite

Use this guidance when a Service Suite scenario needs to call Node.js code or an npm package. Keep package execution controlled, repeatable, and limited to approved dependencies.

## Before execution

- Confirm the package is approved for the AIQ environment.
- Pin dependency versions through the approved package-management process.
- Keep credentials, tokens, and environment-specific values out of source files and articles.
- Document expected input, output, exit code, stdout, and stderr behavior.

## Validation workflow

1. Run the Node.js code with a small local or non-production sample.
2. Confirm Service Suite can locate the script and dependencies.
3. Review output and failures before using the package in a suite or scheduled run.
4. Record dependency changes with the scenario maintenance notes.
