Run Functional Tests from Different Locations

Run Functional Tests from Different Locations

Use this article when Scenario Editor functional tests must execute from different geographic regions, networks, or test nodes.

When to use this guidance

- You need to compare behavior by location or network path.
- Specific test nodes represent different data centers or regions.
- Results must identify where each execution ran.

Recommended approach

1. Confirm the required locations and assign appropriate test nodes or execution pools.
2. Verify browser, driver, network, DNS, and application access from each node.
3. Parameterize environment or location-specific data instead of duplicating scenarios.
4. Run a small smoke test from each location before full execution.
5. Label results by location so failures can be compared accurately.

Note: Use Scenario Editor terminology for functional tests; avoid older Scenario Builder wording.
