

How to escape special characters in Designer

What do we do when we encounter a special character and we have to assert it in a designer script ?

Lets take the below Example:

User navigates to the Apple website and tries to do a assert on iphone page and finds that the iphone 7 has special character " just before 7. So the user now has to assert iPhone"7 which contains a special character just before 7.

We can "\" to escape the special character and run the script successfully.

No	Action	Accessor	Value	Desc...
1	navigateTo		"http://www.apple.com	
2	assertContainsText	div("iPhone")	"iPhone\"7"	

For characters that are usually treated specially, '\' indicates that the next character is not special and should be interpreted literally.
