Pagination - How to search items in a page with multiple paginations

If you want to search for a specificstring, "Testappvance15860" for example, and if is not found then it should click on the next page.

	Store	Job	isVisible(link(Jobname))
	Store	Pagination1	2
	While	Job==false	
	Click	link(Pagination1.toString())	
	Store	Job	isVisible(link(Jobname))
	Store	Pagination1	Pagination1+1
	End While		
	Click	link(Jobname)	

The code will search for the string in the page if the string is not found then it will click on the next pagination

The Js Code is given below

```
var Job=isVisible(link(Jobname));var Pagination=2;log(Pagination.toString());while
(Job==false){click(link(Pagination.toString()));var Job=isVisible(link(Jobname));var
Pagination=Pagination+1;}click(link(Jobname));
```

Pagination assumptions

Set `Jobname` to an accessor that is unique on the target page and initialize `Pagination` to the first page link used by the application. Add a termination condition when the site can exhaust its pages without finding the item; otherwise the loop can continue indefinitely. Validate the script against the application’s actual pagination labels and disabled-state behavior.
