

Bamboo CI Integration with AIQ Dashboard Creation

Last reviewed: September 24, 2026

Use this article when Bamboo triggers AIQ execution and the pipeline also needs to publish or create dashboard evidence.

What changed in this article

- Confirm whether Bamboo is still the active CI tool for the customer; many teams have moved this workflow to Jenkins or another CI service.
- Keep Bamboo plan variables separate from AIQ credentials and dashboard names.
- Validate dashboard creation with one controlled build before enabling scheduled or branch-wide runs.

Validation workflow

1. Review the Bamboo plan variables used to call AIQ.
2. Run a single build and confirm the AIQ execution completes successfully.
3. Verify that the expected dashboard is created or updated with the correct run data.

Review note: Marked Bamboo as customer/environment-specific CI guidance and tightened the scope around dashboard creation.
