Question on SQL Testing in Appvance IQ

Is there a way to check in Appvance IQ that load is actually simulated on the DB under test . Something like graphs which shows activity during the test on the DB with which we can confirm that requests are actually fired?

Checks are usually done at the server side, the way you can check that Appvance is requesting data is checking request and response, Appvance DB system only makes a request and gets a response, You cannot see what the server does internally for which you can use AppDynamics.
