

Install Google Chrome on Ubuntu for AIQ Testing

Install Google Chrome on Ubuntu for AIQ Testing

Install a supported Google Chrome release on the machine that will run browser-based AIQ tests. Follow your organization's approved Ubuntu package-management and browser-update process.

Before running tests:

1. Confirm that the Chrome version is supported by your deployed AIQ version.
2. Install Chrome on each applicable Test Node or execution host.
3. Verify that the AIQ service account can launch the browser.
4. Run a small Scenario Editor test to confirm recording or execution behavior.

Avoid relying on hard-coded package URLs or outdated dependency commands; Chrome installation requirements change by Ubuntu release.
