

OpenStack issue: enabling remote access to a MySQL database (linux)

OpenStack issue: enabling remote access to a MySQL database (linux)

Issue that is seen in Controller is attached below and also error logs has been attached.

Solution:

This steps should fix the issue with the openstack generator not been able to access database:

Start with editing mysql config file in the database machine:

```
vim /etc/mysql/my.cnf
```

Comment out following lines.

```
#bind-address = 127.0.0.1
```

```
#skip-networking
```

If you do not find skip-networking line, add it and comment out it.

Restart mysql server:

```
service mysql restart
```

Enter mysql and execute following queries:

```
GRANT ALL PRIVILEGES ON *.* TO 'utp'@'%' IDENTIFIED BY 'utp' WITH GRANT OPTION;  
FLUSH PRIVILEGES;
```

[Generator_Error_log.txt](#)

```
Setting up iteration.  
Error: Node vm-itye-um-008 failing: IterationSetupRunBroken  
nullRamp up completed.  
Execution done in 1 minutes  
Done.  
Problem running scenario:  
Scenario or resources seem to be invalid.
