

Add JMeter Plugins for AIQ Executions

Last reviewed: September 30, 2026

Use this article when an AIQ JMeter execution requires a supported JMeter plugin that is not included in the base runtime.

What changed in this article

- Corrected capitalization/grammar from “Jmeter” to “JMeter” and framed plugin use as a controlled dependency task.
- Added compatibility checks for plugin version, JMeter version, Test Node availability, restart needs, and result parser impact.
- Added a caution to avoid installing arbitrary plugins directly into shared execution environments without review.

Validation workflow

1. Confirm the JMeter plugin is required and compatible with the AIQ-supported JMeter version.
2. Install or stage the plugin through the approved Test Node/runtime process, then restart only the required services.
3. Run a small JMeter execution and verify logs, transactions, and reports before using the plugin in larger runs.

Review note: This page now focuses on safe plugin dependency management for AIQ JMeter execution.
